

Capybara Gem Scanner – Read Me

Community Edition v50 • Gem scanner for Capybara Go

What is it?

The Capybara Gem Scanner reads your **equipped** and **selected** gems straight off the screen (e.g. BlueStacks) and tells you, for your chosen **build**, whether a gem is worth it. With 8 build guides, a curated gem database, a hero comparison and a loadout overview. German/English, light/dark.

Start (one click)

- Keep all files in **one folder**.
- Double-click “**Edelstein-Scanner starten.bat**”.
- The first run installs everything automatically – please wait a moment.
- If Python was just installed, double-click the .bat **once more**.

How to use

Top right: language (DE ↔ EN) and the **light/dark** toggle (moon/sun). Below that, pick your **build** – it changes the rating in every tab.

- **Quick Scan:** mark one region → it reads ALL gems, rates them for your build and shows the Build Doctor on top.
- **Slot:** pick PvE/PvP and the slot, set two regions (Equipped on the right, Selection on the left), select a gem, press “Scan & compare” → a clear verdict (worth it / not worth it / just embed). With **auto-scan** the tool compares automatically as soon as you view a gem.
- **Hero:** shows your equipment vs the build. The **Build Check** compares your scanned gems against the selected build and flags whatever does NOT fit (including „belongs to build X“). Switching the build re-checks instantly.
- **Skills:** mark the area of the offered skills → the skill doctor tells you, per build, which to LEARN and which to AVOID. With **auto-scan** the tool detects automatically as soon as the skill choice appears. “**Your run**” remembers picked skills and detects synergies.
- **Loadout:** all slots at a glance. **Guide:** full build specs.

Build Doctor

The Quick Scan opens with a clear verdict for your build: **Keep** (strong gems) vs. **Swap** (weak ones, each with the reason), plus “**Best for this build**” – the highest-rated gems to aim for. One scan – you instantly see what to change.

Light / dark & design

The **moon/sun** button switches between the light Capybara-image theme (sky-blue, gold) and a dark night-sky theme (navy with sky-blue, gold and turquoise). Your choice is remembered. Want your own banner? Just replace “**capybara_banner.png**” in the folder.

The gem database

gems.json is curated and updated via the **Online update** button, so the values stay consistent. Unknown gems are still understood from keywords (marked ~). Detected wrong or missing? Turn on “show details”, copy the text and report it.

Note – Antivirus (false positive)

Some antivirus tools may flag this program. **This is a false positive – it is not malware.** Why: the tool **takes screenshots** (that's how it reads the gems) and the launcher **auto-installs Python packages on the first run** – scanners flag this just in case.

No data is sent anywhere. Everything runs locally; only the optional online update downloads from a URL **you** type in yourself. The source code (capybara_gem_scanner.py) is open and readable.

Fix: add the tool's folder as an exclusion/whitelist. In **Windows Defender**: Virus & threat protection → Manage settings → Exclusions → Add an exclusion → Folder. (Or, after a block, choose “Allow on device” in Protection history.)

Disclaimer / Legal

Unofficial fan tool. Not affiliated with or endorsed by the makers of “Capybara Go”; all game names, logos and trademarks belong to their respective owners.

The tool **only reads your screen and gives advice** – it does not modify the game or automate anything. Using third-party tools with a game may be subject to the game's **Terms of Service** – **use at your own risk**. All values are community estimates, not official data.
